

**Conveyor Emergency Stop
Reflective Tag for use on pullwire cable
(as per AS1755-2000)**

As a requirement of AS1755, all lanyard pullwire cables should be labelled indicating that the pullwire cable can be used as an emergency stop.

The Austdac TAG003 allows you to comply with this requirement.

The tag is 19cm long, 5cm wide and can be attached in several orientations using cable ties. The tag can be mounted such that it can be seen clearly when looking down the line of the conveyor.

In some existing installations when “tape label” is used as an emergency label they can not be seen clearly and, therefore do not clearly identify the purpose of the pullwire cable.

The Australian Standard AS1755-2000 Conveyors-Safety Requirements Section 2.9.4 states:

Each manually operated stop, start or other function control shall be identified with markings, signs or labels in writing, clearly indicating the purpose of the control; and that signs shall be provided at each end and every 30m along a conveyor where a pullwire is used e.g. emergency stop.
